

Respond to the following question(s) in TopHat in 100+ words

What concept or idea stood out the most to you during her presentation?

What about Christabel's guest lecture intrigued you the most, or made you feel engaged?

What is one thing that you see yourself applying to your research, and how?

I feel the idea that some research methods when trying to gain information depends on the certain group of people. I guess that I have never thought about it that way before where you might not get valid information because some groups may lie to remain anonymous or that other groups like homeless people couldn't be fully

I really think that the idea of ethics is really important because I think some people forget that these are real people that sociology has to study. Using a set of standards when researching these people is very important. Using consent is important before starting any kind of research and allowing patients to leave when they are uncomfortable is also a part of this. Keeping those anonymous when they ask is also very important because

The more in depth analysis on which methods would be best for different situations stood out to me, she was very engaged and enthusiastic in getting engagement. I could see using these methods in different ways in my

Christabel is a very strong and well spoken lecturer, I felt very engaged the whole time and something that interested me the most was her talk of different methods of research. Something I see myself applying to my

I loved how Christabel talked about the different study methods! Also how she made sure to keep checking in with the class to make sure we understood the material and if we had any questions at anytime. I find myself A concept that stood out to me the most was the Participant version of Observation, it's a new concept to me that explained how you can become the person you're observing to get a better picture of the data without biases involved. What kept me engaged was how Christabel kept drawing everything back to

I found her presentation to be very engaging. I never really knew how to tell which research method is the best depending on the situation. Her speech gave me a good understanding of this concept which I will be able to apply to my own research. I she had a good tone and volume which helped me feel engaged to the speech. The

I feel like Christabel was very well spoken and had a strong idea of how she wants to present her knowledge. Due to this it came off very smoothly. Her presentation was clean and very informative. It was awesome that she During the guest lecture, the concept that during the sociology research process, even though it is a science, you can skip the formulate hypothesis step. As a Forensic Chemistry major, I thought this was interesting because I didn't think you could skip the hypothesis stage no matter what. Another concept that stood out to me was that no matter the type of research you do, there is always a disadvantage or bias present. I definitely knew this in the back of my head, but I have never actually thought about it before. When we were talking about ethics, I

The thing about Christabel's guest lecture that intrigued me the most was the fact that she kept checking in on the class and asking informed questions to the class to keep us engaged. Another thing was the in-depth

During her lecture what stood out to me the most is the different methods of collecting data and like conducting research. I was unaware there were so many ways to conduct research depending on the group or topic you are focused on. The part of the lecture that made me feel engaged is that she kept asking the class if we can hear her

I liked when she discussed the methods for conducting research. I feel like I learned a lot about how to choose the best method depending on the research I want to conduct. I can see myself applying the things that I learned about choosing a research method to future research that I may do. I also liked the part about ethics, because it The idea of being ethical when conducting sociological research stood out to me the most, as it is important to make sure the people you are studying feel secure and do not feel judged when going about their daily lives. I was intrigued by the different ways in which ethics are maintained, and was surprised that avoiding physical harm was on the list. It worries me to think that people conducting this kind of research would do any physical I really liked her presentation today, one of the things that stood out for me is the research ethics in sociology, as someone who interested in scientific research, the ethics & morals are very similar when the research is being After listening to Christabel's lecture, which was well organized, easy to understand, and followed a good flow, I can see myself applying ethics. I already had an idea of ethics related to sociology, but after the lecture, I learned quite a lot about ethics and can see myself using it for future assignments or for other future possibilities. Christabel made great points and structured her lecture well with government, addiction, family, A concept that stood out to me was the ethical guidelines a researcher has to follow. I was surprised at how much there were and how in depth they could go. I wonder if these were all added at one time or if they were continually growing as people develop. What I liked about Christabel's guest lecture was how quick and In today's lecture we discussed homelessness in the USA and what affects the amount of homeless people. The guest speaker, Christabel, had an interesting perspective on what is the main factor of homelessness in the USA. She said the government had the most impact on the crisis happening all around the country. Another point that grabbed my attention was talking about the different types of research methods available for conducting experiments. She said surveys, interviews, etc. are types of research methods that are used in the world of

Christabel is very knowledgeable on the different types of research methods and how we can use them to gain and understand different information and results. The TopHat presentation she had was very formal and displayed her reasonings and understandings in a comprehensive manner. I think that the most interesting part of her lecture was the concept of homelessness and how large of a problem it actually is. After partaking in the The concept of ethics stood out to me because it differs across the ways to research. Also, because it is a social science and dealing with real people, it is important to look at the ethical implications of your research. The Christabel has a very secure grasp on research methods and how we manipulate them to get different results. Her presentation was professional and showed her thoughts clearly, with small amounts of text that were easy to understand. Everything relates back to statistics and that connection makes sociological research easier to understand. I appreciate the amount of interactive questions she asked and how much she asked if we understood the information being given. I already use my own research methods everyday as a chemist. I just I was most intrigued by the different methodologies of sociological research. She gave the examples of interviews, observations, and surveys. Which method is dependent on what your research question is. Also, sometimes you have to choose a less in-depth method for the sake of getting a large population size, or for cost-effective reasons. Also, when you use observation in research, there can be some ethical constraints. I think Definitely talking about homelessness. As big as a problem that it is, it lacks getting talked about and help given to people dealing with homelessness. I wouldn't say that there's a definitive thing that I would carry into my I liked the differences of research methods and how we use them and get different results from them. I also liked how she didn't have a bunch on tests on each slide that would have to be read and write, just enough to

The idea that stood out to me the most was the fact that observation is both participated in and observed by the researcher. I never really thought about the fact that the observation method was specific to sociology, either. I felt engaged when we had to match the examples to the research methods, it allowed me to understand each. The ethics of research are extremely important and I was very engaged in Christabel's comments about them. For example, her saying that the researcher should ask sensitive questions that do not make the participant feel I really liked our guest presentation. This topic is very familiar to me because I am a psychology student, and research is a big part of the major. She broke down each step of sociological research very well, and it was easy to follow along with. I think the ethics of research intrigued me the most and made me feel really engaged with the lecture. As someone who is doing research within my research methods class, I see myself using tactics like. The thing that Christabel's guest lecture that intrigued me the most was the class activity that would do. Where we had to all say what we think would be the most effective way to research data in sociology. The idea that intrigued me the most were the different research methods that you do in sociology. I personally want to go into

One concept that stood out to me was homelessness. Where I am from, there are a lot of homeless people around, and it makes you wonder how they ended up there. I liked how she went into how homeless people end up homeless, which was a question I had. One thing about the lecture that made me feel engaged was how she. One thing that intrigued me the most was the beginning, when she asked what are some of our ideas of causes of homelessness. She pointed out that these reasons, are typically used to diminish the possibility of looking for solutions. As claiming that addiction, or family troubles are what causes people to be homeless, are self-. The thing I found intriguing that I could apply to my research were the different methods of gathering data from people. While I'm not really sure I can have a good opportunity to try out observation just because of time restraints and having other things to do, I could gather good, widespread data from surveys and more in depth. I really enjoyed learning about different methods of research. I believe the topics talked about were complicated and hard, and I liked to hear about how we could further study these topics. Like surveys, observations, and interviews. This shows how big science can really be. Science connects to the entire world, especially socially. I was interested to learn that the ethics of research in Sociology is so important. It is important to know that researchers are studying real people, not just data. People aren't hurt or exploited, or put at risk, participants give informed consent, and personal information is kept private. I can see myself applying ethics to my research, the idea that stood out the most to me about the interview was the differences in research methods in sociology and how to use them in different scenarios. The thing that intrigued and engaged me the most was when we were going into depth about the ethics. One thing that I see myself using for my research could be the different. The concept that stood out the most to me was the ethics behind sociological research. This is something that's very important to remember and can be applied to all research done. I felt engaged because she was a very good speaker who that projected her voice well. Made sure to explain things thoroughly. I can see myself applying. I really liked the way that she explained how different the data collections were. She gave really good examples on how to understand the difference between observations, surveys, and interviews. I think she was very. I was interested to find that, in sociology, research is conducted in much the same way as any other science. Sociological research follows the scientific method, which involves asking questions, forming hypotheses, performing experiments, and drawing conclusions from the results of these experiments. Unlike in other sciences, where you may be taking measurements or mixing chemicals, in sociology, researchers give surveys and interviews and observe subjects. Each of these research methods has its pros and cons and may be more appropriate for one study versus another. For example, for a study of people living in the United States, a survey

The idea that stood out the most to me was the idea of using different methods for different people and situations. She was a very well spoken person and I think I felt most engaged when we were asked our opinions

During the guest lecture today, I was intrigued by the different methods of research I could conduct through experimentation. Christabel explained thoroughly how research requires trial and error, especially when studying sociology. It was very engaging when she interacted with the class, giving example scenarios and asking an idea that stood out the most to me was the different methods on how to conduct your research. Although these are common knowledge looking at different questions it is very important to know exactly what way you should conduct your research because if you don't it can cause a lot of issues such as taking too much time or putting your own bias into your research which is ethically not allowed. Christabel did an amazing job in her

The thing that stood out the most to me was that each research method can fit a different topic more than another. Especially when we put it in real life situations, you can see how different scenarios need different methods to get accurate information. I felt the most engaged in the interactive part, the Tophat questions. This is the most engaging part for me because we have to use what she talked about and answer questions for I thought it was really interesting how she explained that ethics are very important when doing sociological research. I thought it was important to know that it should be confidential and consensual. It was good to know that you need to form a hypothesis and can collect data through surveys, questionnaires, or interviews. It is best to have a large sample size. Surveys seem to be one of the better choices because they are quicker than I like the variety of methods and how we could use them. I also liked brain storming ideas on what methods we would choose and why. I chose to study homelessness because I feel as a society we tend to judge someone or something before getting to know how or why they are in that situation. I feel like because of this method we can really look more deeply into other people's lives and how some people just didn't have the same resources we had growing up, and that it's not necessarily what they did wrong it's just the cards they Christabel going over the three different methods for conducting research was very informative and helped me understand more about the world of research. I was unaware of the methods of research in general, let alone knowing when to apply each method to specific situations. I will be sure to apply these methods of research in

The concept of there being better methods for different types of studies stood out to me the most because I wouldn't have thought about how to use these different methods in different scenarios. She had a great grasp on the concepts she presented us with, and the most intriguing and engaging part of her lecture was when she gave us the homelessness example to keep falling back on. This helped me grasp the concepts well and ensure my The thing that stood out to me the most was the different methods of research that Christabel highlighted in her presentation. It was so cool to see how what method you need varies situation to situation, and I think it will be very useful to me in the future. I also enjoyed the part about ethics and plan to use the information I now know in the future to keep my research fair and legal above all else. Overall I thought her presentation was very well put together and easy to understand, and I will definitely be using the methods I have learned in the future when After listening to our guest speaker, I found a lot of the things that were explained to us really interesting. I learned more about the benefits, and also the disadvantages to using different research methods like surveys, interviews, and observations. Surveys can collect large samples, but it is limited in depth. Interviews offer in depth responses, but it is time consuming. And observation provides researchers with a deeper understanding, but it is hard to generalize. We also learned about the sociological research process. This process consists of I liked the way that she interacted with the group, and asked for their opinions and ideas before elaborating, or using the group responses as a way to prove a point/segue into a new point. She explained things very clearly and established her credibility and knowledge about the topics without leaving us behind and confused. While the
